Topics in Harmonic Analysis Related to the Littlewood-Paley Theory. (AM-63), Volume 63. This work deals with an extension of the classical Littlewood-Paley theory in the context of symmetric diffusion semigroups. In this general setting there are applications to a variety of problems, such as those arising in the study of the expansions coming from second order elliptic operators.

SHA is a version of harmonic analysis operating in the spaces of periodic splines of defect 1 with equidistant nodes. Discrete Fourier transform is a special case of SHA. The continuous Fourier analysis is the limit case of SHA as the degree of splines involved tends to infinity. Thus, SHA bridges the gap between the discrete and the continuous versions of Fourier analysis.

There are strong connections between harmonic analysis and ergodic theory. A recent example of this interaction is the proof of the spectacular result by Terence Tao and Ben Green that the set of prime numbers contains arbitrarily long arithmetic progressions.

The purpose of this project is to further develop and employ tools in harmonic analysis to investigate various open questions related to these topics. The underlying theme of the project is the use of real variable techniques to study behavior of nonlinear equations (both deterministic and random) in the presence of a large parameter.

The harmonic-analysis chart shows how the different wavelengths interact with red light. At a difference of $\lambda/2$ (half wavelength), red is perfectly in sync with its second harmonic in the ultraviolet. All other wavelengths in the visual spectrum have less than a $\lambda/2$ difference between them, forming harmonic oscillations in the combined waves.
